

According to the [StyleCop Rules Documentation](#) the ordering is as follows.
Within a class, struct or interface: (SA1201 and SA1203)

- Constant Fields
- Fields
- Constructors
- Finalizers (Destructors)
- Delegates
- Events
- Enums
- Interfaces
- Properties
- Indexers
- Methods
- Structs
- Classes

Within each of these groups order by access: (SA1202)

- public
- internal
- protected internal
- protected
- private

Within each of the access groups, order by static, then non-static: (SA1204)

- static
- non-static

Within each of the static/non-static groups of fields, order by readonly, then non-readonly :
(SA1214 and SA1215)

- readonly
- non-readonly
- An unrolled list is 130 lines long, so I won't unroll it here. The methods part unrolled is:
 - public static methods
 - public methods
 - internal static methods
 - internal methods
 - protected internal static methods
 - protected internal methods
 - protected static methods

- protected methods
- private static methods
- private methods

The documentation notes that if the prescribed order isn't suitable - say, multiple interfaces are being implemented, and the interface methods and properties should be grouped together - then use a partial class to group the related methods and properties together.
